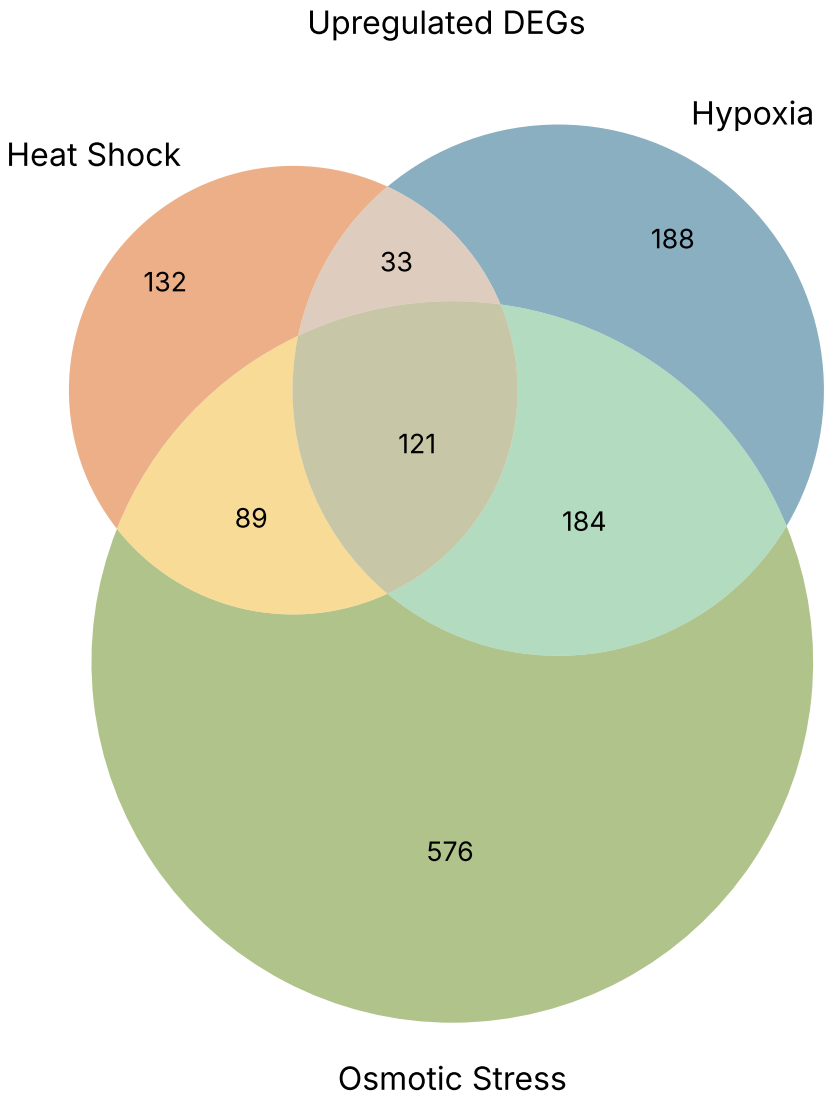
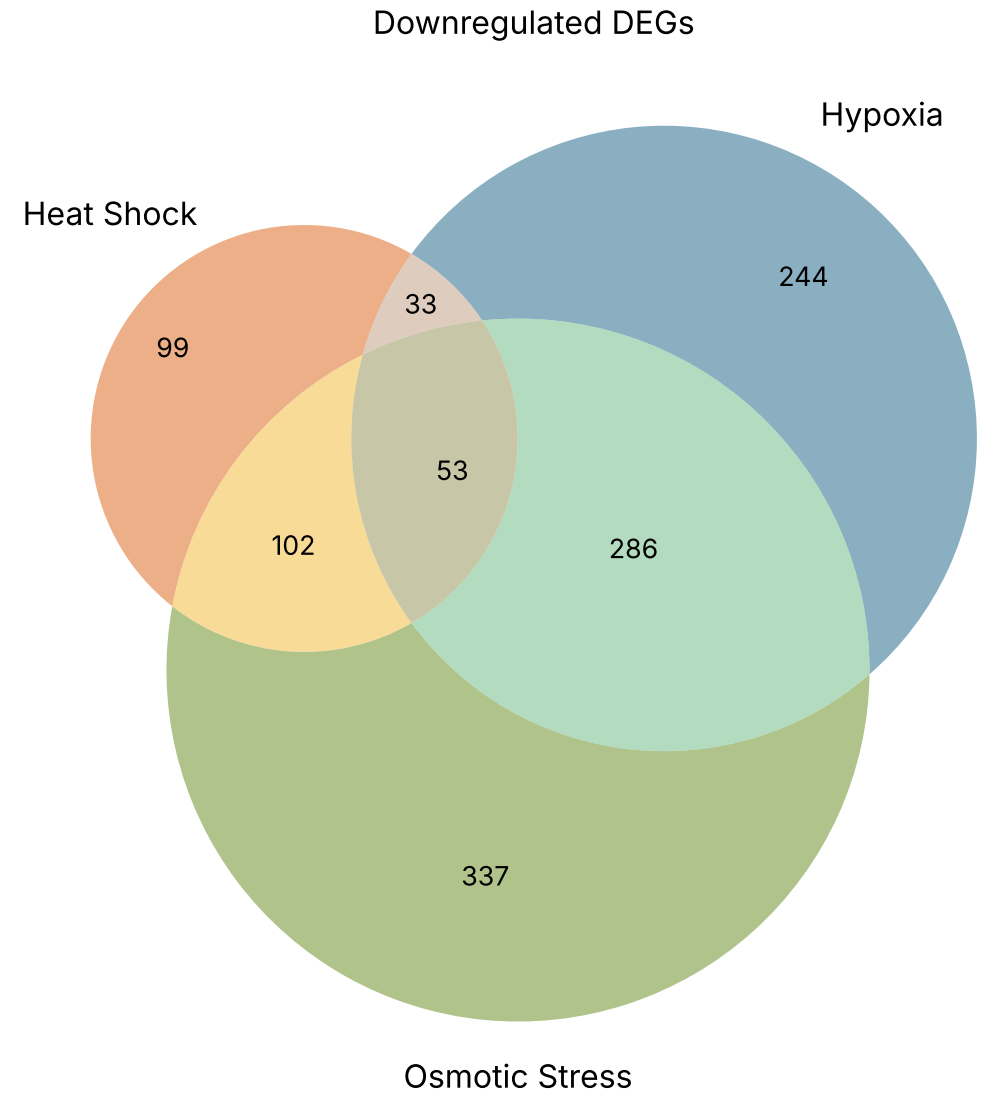
Shared vs. dataset-specific DEGs across three environmental stresses
(broad definition: not a same-direction DEG in the other two datasets)





Note: numbers above use the broad definition of "dataset-specific" (not DEG in the same direction in the other two datasets). Under a strict definition (absent from ALL DEG lists, either direction), specific counts are slightly lower: Heat Shock 121 up / 85 down; Hypoxia 183 up / 230 down; Osmotic Stress 554 up / 324 down (see Table 3).
